

Removing Blemishes

Sources of blemishes

- Dirty computer screen!
- Water droplets on lens
- Dust on lens
- Fingerprint on lens
- Dust on sensor
- Greasy spot on sensor
- People/birds in my landscape!

Identifying blemishes

- Dirty screen
Spot in same place when no image on screen!
- Water droplets on lens
Large area blurry
- Dust on lens
Small area darker & blurry
- Fingerprint on lens
May not show up at all but can ruin coating - may add blurriness if other grease present

Identifying blemishes

- Dust on sensor
Shows up more at small aperture (larger F stop) mostly as well defined dark spots in sky
- Greasy spot on sensor
Shows up more at small aperture (larger F stop) mostly as well larger slightly darker spots in sky
- People/birds in my landscape!
Distant birds in the sky can be a distraction

Identifying blemishes

- Image processing can highlight spots - especially clarity and dehaze

Lightroom Tools

Complete all other image processing before removing spots

- Spot removal Tool (Keyboard short cut **Q**)
- Adjustment brush (Keyboard short cut **K**)
- Radial filter (Keyboard short cut ***shift* M**)

Spot Removal Tool

For spots! and birds, small people & other distractions

- In Develop Module's Basic menu click on tool or press Q
 - Options
 - Set size
 - Clone
 - Heal

Spot Removal Tool

For sensor dust the spot will be in the same place in all un-cropped images of the same orientation,

Use the copy and paste tool to deal with a batch of images.

Adjustment brush & Radial filter

Useful for areas that are brighter or darker than surroundings - may not remove - but can diminish impact
- eg for lens flare or water drops

When these don't work

For larger areas/objects Photoshop can work well

- Heal
- Clone heal
- Patch
- Delete with “content aware” fill
